Welcome

You're a dispatcher at LogisX — the person who connects loads to drivers and keeps the fleet moving. This guide is everything you'll touch in the app on a daily, weekly, and as-needed basis.

What dispatch does

The dispatcher role is the operational center of LogisX. Loads arrive from brokers — usually automatically from emailed rate confirmations, sometimes manually. You assign them to drivers, track the trucks live, handle status corrections, manage expense submissions, and communicate with the drivers throughout. When something goes off-script, you're the first responder.

You report to Super Admin and escalate financial or policy decisions to them. They handle invoice approvals, user management, and the things that touch money or contracts. You handle the rest.

What this guide covers

- **Getting started** — your home screen, the four dashboard tabs, the basic flow of a day.
- **The job board** — where unassigned loads come from and how to assign them.
- **Reassignment** — moving loads between drivers mid-trip.
- **The tracking map** — reading live driver positions and ETAs.
- **Status management** — when geofencing isn't enough.
- **Expenses** — reviewing what drivers submit; logging on their behalf.
- **Messaging** — chat with drivers, scoped to specific loads when useful.
- **Customer tracking** — sharing the public tracker URL with brokers and shippers.
- **Notifications** — the catch-all alert feed.
- **Fleet view** — trucks, trailers, who's available.
- **Best practices** — habits that make the job easier.
- **Troubleshooting and FAQ** — every weird situation and how to handle it.

What this guide doesn't cover

- **Hiring and firing** — that's Super Admin (review applications, approve/reject).
- **Pay and invoices** — Super Admin approves invoices. You'll see expenses but not weekly pay decisions.
- **System configuration** — user accounts, role changes, data integrity tools — all Super Admin.
- **Customer pricing and broker negotiations** — handled outside LogisX or by leadership.

If you find yourself wanting to do one of those things, escalate to Super Admin rather than trying to do it yourself.

How to read this guide

Each chapter is self-contained — you can jump to the one you need. New dispatchers should read top to bottom on day one. Experienced dispatchers can use it as a reference and skim only what's new.

The screenshots show the dashboard as it appeared at publication. If your screen looks slightly different, the platform has been updated; the workflow is the same.

A note on tempo

Dispatching is a job with bursts of activity and stretches of calm. New loads arrive in clusters in the morning. Drivers report status throughout the day. Issues come up unpredictably. Some days you'll be answering five messages at once; other days you'll be watching a few loads roll uneventfully across the country.

The app is designed for both modes. It updates in real time when something happens — you don't have to refresh — and it stays out of your way when nothing does. The right rhythm is to glance at the dashboard a few times an hour during active periods and respond to anything that needs you.

A note on tone with drivers

You're the voice of the company to every driver. They see your messages, your reassignment decisions, your status corrections. They notice the tone.

Be direct, clear, and respectful. Acknowledge what they're dealing with. Don't talk down. Don't blame. When you have to deliver bad news (a cancelled load, a refusal of an expense), do it cleanly and explain why.

Drivers who feel respected work harder and stay longer. The whole company benefits.

Let's get into the work.

Quick Start

What you'll see when you sign in, what each part is for, and how a typical day flows.

Signing in

Go to `app.logisx.com`. Sign in with your dispatcher credentials. You land on the **Operations Dashboard** at `/dashboard`.

The dashboard at a glance

The dashboard has a header strip of KPI cards across the top showing current totals (active loads, pending loads, trucks on the road, revenue this period), then a tabbed area below with four tabs.

TAB	CONTENTS
Job Board	Unassigned loads waiting for a driver. New arrivals from broker emails land here.
Active Loads	Loads currently in progress (dispatched, in transit, at receiver, etc.).
Completed Loads	Delivered loads, most recent first.
Fleet	Drivers and trucks — who's available, who's busy.

Click any tab to switch. Each tab shows a count badge so you can see at a glance how many loads are in each state.

The sidebar

On the left (desktop) or behind a hamburger menu (mobile/tablet), the sidebar gives you access to:

- **Dashboard** — back to the main operations view.
- **Tracking** — the live map showing every active truck.
- **Expenses** — driver expense submissions.
- **Messages** — chat threads with each driver.
- **Notifications** — system-generated alert feed.
- **Trucks** — fleet inventory (view-only mostly; some edits if your role allows).
- **Trailers** — same for trailers.

A typical day

Roughly what your day looks like:

Morning (7–10 AM):

- New loads arrive overnight from broker emails. Open Job Board.
- Match each load to an available driver. Click load → pick driver → Assign.
- Drivers respond accept/decline. You see the responses in real time.
- Address any declines — pick a different driver, or message dispatch lead.

Mid-day (10 AM–2 PM):

- Watch tracking map. Address anything unusual (stuck driver, wrong route, status not advancing).
- Respond to driver messages as they come in.
- Approve or follow up on expense submissions.

Afternoon (2–5 PM):

- Drivers start delivering. Watch for POD uploads.
- Status updates roll through. Spot-check anything that looks off.
- New loads continue to arrive throughout — handle in real time.

End of day:

- Quick check: every active load has a current status, every recent load has a POD.
- Any pending issues (delayed deliveries, missing PODs) get flagged for follow-up.
- Hand off to after-hours dispatch (if applicable).

Most of this is reactive — you respond to what the app surfaces. The app does most of the work; you handle the exceptions.

Real-time updates

The dashboard updates automatically when:

- A new load arrives (Job Board count goes up).
- A driver accepts or declines (you see immediately).
- A driver reports a new GPS position (tracking map moves).
- A driver updates status (Active Loads tab refreshes).
- A POD is uploaded (Active Loads tab updates).
- A driver sends a message (Messages tab badge increments).

You don't need to refresh. If you don't see something you expect, refresh manually — but in 99% of cases the screen is already current.

Click anywhere to drill in

Almost everything on the dashboard is clickable. The general rule:

- **Click a card** in a list → open the detail view for that item.

- **Click a name** in any table → open that person's profile or thread.
- **Click a number** in a KPI card → filter the relevant view by that metric.

If you're not sure what something does, click it. The app is forgiving — almost every action has an undo or is reversible.

Search

There's a search bar in the dashboard's job board and active loads area. Type a Load ID, broker name, city, or driver name. Results filter in real time.

For larger or older loads, the **Archive** is the place to look (Super Admin only, but you can ask).

What you can do, what you can't

You **can**:

- Assign and reassign loads.
- Update load status.
- Send and receive messages with drivers.
- Add expenses on behalf of drivers (e.g., when a driver pays for something by phone).
- View the tracking map.
- Read the public customer tracker for any load.
- View trucks and trailers (mostly read-only).

You **cannot**:

- Cancel a load (Super Admin only).
- Approve or reject expense submissions (Super Admin).
- Approve invoices (Super Admin).
- Access the financials dashboard (Super Admin).
- Add or edit user accounts (Super Admin).
- Edit truck records beyond basic viewing.

Things on the "can't" list aren't roadblocks — they're decisions that need to flow through Super Admin. Escalate when needed.

What goes wrong on day one

A few common day-one frustrations:

- **"I can't see the full job board."** — Refresh. If the loads aren't there, n8n may not have ingested them yet, or they may already be assigned.
- **"The driver isn't responding."** — Check their GPS on tracking. They may be off duty. Try a phone call.
- **"I see a load that says 'cancelled' but I didn't cancel it."** — A Super Admin did. Check the Notifications tab for the audit entry.
- **"I'm getting too many notifications."** — Right now there's no filter. You learn which ones to glance at and which to act on. Most are informational.

The rest of this guide covers each of these in detail.

The Job Board

The **Job Board** is where every load you need to assign lives. New ones arrive here from broker emails; you move them out of here by assigning a driver.

Where loads come from

Most loads arrive **automatically**. When a broker emails a rate confirmation to `info@logisx.com`, an automated workflow on the backend:

1. Reads the email.
2. Parses the attached PDF rate confirmation.
3. Extracts the load details (pickup, delivery, rate, broker reference, etc.).
4. Posts the extracted data to the LogisX server.
5. A new row appears on the Job Board within seconds.

You'll know a new load arrived because:

- The Job Board count in the header goes up.
- A brief notification highlights the new load on the dashboard.
- The **Notifications** tab shows the arrival.

Some loads arrive **manually** — entered by you or another dispatcher via the **New Job** button. Use manual entry for:

- Loads phoned in by a broker without an email.
- Re-entry of a load that got mis-parsed by automation.
- Internal moves not tied to a broker.

Manual entry opens a form. Fill in the broker, pickup, dropoff, rate, dates, and any notes; save; the load appears on the Job Board.

Reading a load card

Each load on the Job Board is a card. The key fields:

- **Load ID** — the unique identifier (e.g., `LD-3492`). This is what brokers, drivers, and customers reference.

- **Broker** — who emailed the load.
- **Pickup** — city, state, ZIP, plus the pickup appointment time.
- **Drop-off** — same for delivery.
- **Rate** — the payment the broker has agreed to.
- **Equipment** — type required (dry van, reefer, flatbed, etc.).
- **Notes** — anything special the broker flagged.

Click the card to open the full detail view. Everything you need to make an assignment decision is visible.

Assigning a load

To assign:

1. **Open the load.** Click its card on the Job Board.
2. **Pick a driver from the Driver dropdown.** Only available drivers (those not currently on an active load) appear. If a driver you want isn't listed, they're already on something — check Active Loads to confirm.
3. **Click Assign.**

What happens next:

- The load disappears from the Job Board.
- It appears in Active Loads with status **Dispatched**.
- The driver gets a real-time notification on their phone.
- The driver sees the load on their Loads tab with Accept/Decline buttons.

You don't have to wait for the driver to accept before moving on to the next assignment. They have to take some action (accept or decline), but until they do, the load is "dispatched" and ready for them.

Driver responses

After you assign, the driver will:

- **Accept** — most common. Load moves to "Accepted" status and into their active queue.
- **Decline** — happens. The load returns to the Job Board. You'll see a notification with the decline reason (if the driver gave one).

When a driver declines, the load needs reassignment. See the Reassignment chapter.

Choosing the right driver

Things to consider when picking from the dropdown:

- **Location.** Is the driver close to the pickup? Long deadheads waste time and fuel.
- **Equipment type.** Does their truck match what the load needs?
- **HOS.** Do they have enough hours to make the pickup and delivery on time?
- **Rate.** Does the driver-specific rate (daily or percentage) work for this load?
- **History.** Has the driver run for this broker before? Some brokers prefer specific drivers.
- **Personal preferences.** Drivers tell you the kinds of loads they want. Honor it when you can.

There's no scoring algorithm — these are judgment calls. The app surfaces the available drivers; you choose.

Bulk operations

If multiple new loads land at once (common in the morning), assign them one at a time. There's currently no bulk-assign feature. The clicks add up, but each takes 10–20 seconds — five loads is two minutes total.

Loads that linger on the Job Board

Some loads will sit on the Job Board for a while. Reasons:

- **No available driver in the area.** You may need to wait for a delivery to complete, or message a driver about a slightly off-route load.
- **Bad pickup window.** A load that picks up 600 miles away in 4 hours can't be run. Either decline to the broker or reschedule.
- **Equipment mismatch.** No flatbeds available for a flatbed load. Tell the broker.

If a load is stale (more than 24 hours on the board), check whether it's still viable. The broker may have given it to a different carrier already.

When to decline a load to the broker

Sometimes you'll get a load that just doesn't make sense:

- Pickup is across the country and you have no driver heading that way.
- The rate is too low for the miles.
- The equipment isn't right.
- The pickup or delivery window is unworkable.

Don't sit on it. Call or email the broker, decline cleanly, and move on. The broker would rather know now than discover at the pickup that no one is coming.

Declining to a broker is handled outside the LogisX app — by phone or email — not via the dashboard. Once you've declined, you can manually delete the load from the system (ask Super Admin) or just leave it for the day to roll off.

Search and filter

The Job Board has a search bar. Common uses:

- **Search by Load ID** — find a specific load.
- **Search by broker** — see all loads from one broker.
- **Search by city** — find loads near a particular area.

There's no advanced filter UI; the search is plain-text on multiple fields. Most dispatchers don't need filters — the Job Board rarely has more than a handful of loads at once.

Pro tips

- **Glance at the Job Board first thing in the morning.** Anything that arrived overnight is your first work of the day.
- **Don't accept loads on the broker's side then never assign them.** A load sitting on the Job Board for days makes the broker think you don't have capacity.
- **Watch for duplicates.** Occasionally a broker re-sends a rate confirmation and you get two of the same load. The Admin Tools have a "Scan Duplicates" feature — ask Super Admin to run it monthly.
- **Note the broker.** Different brokers have different quirks. Some are easy; some require constant updates. Build a mental map.

Reassignment

A load is in progress with a driver, and something changes. The driver gets sick, breaks down, runs out of hours, or you need to optimize routing. You can move the load to a different driver mid-trip.

When to reassign

Common scenarios:

- **Driver A's HOS runs out.** They're 200 miles from delivery; Driver B is closer and has hours.
- **Driver A's truck breaks down.** Repair will take a day; the load needs to deliver tonight.
- **Driver A had a personal emergency.** They have to get home; the load needs to keep moving.
- **You realize a better match.** Driver A accepted the load but Driver B is now in a much better position for it.
- **Driver A declined.** They started running and decided they can't finish. Rare but it happens.

Reassignment is faster than cancelling and re-creating the load, and it preserves the load's history.

How to reassign

1. **Open the load** from the **Active Loads** tab.
2. **Find the Driver dropdown** in the load detail view.
3. **Pick the new driver.**
4. **Click Save** (or Reassign — the button text may differ).

What happens:

- **Old driver** sees the load disappear from their Loads tab and gets a notification "load reassigned."
- **New driver** sees the load appear on their Loads tab with status whatever it was (At Shipper, In Transit, At Receiver — not reset to Dispatched).
- **Load status doesn't change.** A load that was At Receiver stays At Receiver. The new driver picks up wherever the old one left off.

This is intentional. Reassignment is a hand-off, not a restart.

Coordinating the hand-off

The app moves the load record cleanly, but the real-world hand-off requires coordination:

- **Where are they meeting?** If Driver A has the trailer at a truck stop, Driver B needs to know where.
- **Bobtail or with trailer?** Some hand-offs are bobtail (driver B comes empty, hooks up to Driver A's trailer). Some require driver B to bring an empty trailer.
- **Paperwork.** Driver A's been keeping the BOL with the freight. Driver B needs it.
- **Keys, fuel card, communication.** All sorts of practical details depend on the situation.

Use the Messages tab to coordinate. Send a message to both drivers with the meet-up details, then verify they've connected.

Special cases

Driver A is at a shipper, hasn't picked up yet

Easiest case. Reassign the load. Driver B becomes the new picker.

If Driver A is physically at the shipper, message them to walk away — they don't need to do anything physically, and the shipper can wait for Driver B.

Driver A picked up and is in transit

Hand-off at a truck stop or rest area is typical. Driver A drops the trailer; Driver B picks it up. Coordinate the location and timing via Messages.

Some receivers don't accept driver changes mid-trip — if that's a concern, message the broker.

Driver A is at the receiver

If the freight is still on the truck, Driver B can complete the unload. Reassign.

If the freight is already off the truck (delivery complete, just no POD yet), this isn't really a reassignment — it's a POD upload issue. Better to have Driver A upload the POD (even from a different location) than complicate the load record.

Driver A had an accident

This is the worst case. The load is on a truck that's not moving for hours or days. Decisions:

1. Is the freight OK? Photograph if you can.
2. Can Driver B come retrieve it (with permission of authorities)?
3. Is recovery needed first? Towing, insurance, etc.

Reassignment in the app is the easy part. Coordination is everything.

When NOT to reassign

A few scenarios where reassignment isn't the right call:

- **The load is already delivered with POD uploaded.** It's done. Don't reassign.
- **The driver had a tiny gripe and you're capitulating.** Drivers sometimes complain because they're tired or had a bad day. Talk through it before reassigning.
- **The new driver doesn't actually have hours.** Reassignment with a driver who can't run it just moves the problem. Verify before clicking.
- **You haven't asked Driver A.** Sometimes Driver A has a plan you don't know about (they were going to ask for a partial swap with Driver B already). Talk to them first.

When in doubt, message both drivers, get alignment, then reassign.

Status doesn't reset

Reassignment preserves the load's current status. If the load was at **At Receiver**, it stays At Receiver after reassignment. Driver B inherits the in-progress status.

This means:

- Driver B doesn't have to "re-accept" the load. It's just theirs.
- The geofence is still aware of the load's location. If Driver B arrives at the geofence and status is appropriate, auto-advance still works.
- The customer tracker is unaffected — they see the same load progressing.

The one thing that does change is the driver name visible on the load. Old name → new name.

Audit trail

Every reassignment is logged:

- **Notifications tab** shows the reassignment event.

- **Audit trail** (Super Admin) has a full record.
- **The load history** shows the swap.

If anyone asks "why did Driver A start this load and Driver B finish it?", the answer is in the system.

A cleaner workflow

For a clean reassignment, the steps in order:

1. **Decide it's the right move.** Talk to Driver A, Driver B, the broker if needed.
2. **Confirm Driver B has hours and equipment.**
3. **Coordinate the meet-up.** Location, time, who brings what.
4. **Reassign in the app.** This step is the easy one.
5. **Message both drivers** with confirmation and any final instructions.
6. **Update the broker** if they need to know (some do, some don't).
7. **Monitor.** Once Driver B is in possession, watch their tracking like any other load.

The first three steps take more time than the actual reassignment click. Plan for that.

When reassignment is the wrong tool

If a driver is fundamentally unable to finish a load (truck destroyed, driver hospitalized) and there's no replacement available, reassignment doesn't solve the problem. In that case:

1. **Tell the broker.** They may agree to extend the delivery window or take it back.
2. **Escalate to Super Admin.** They can cancel the load if needed (you can't).
3. **Document.** Photographs, conversation logs, anything that explains what happened.

The app gives you tools, not magic. Real-world logistics is still messy.

The Live Tracking Map

The tracking map at `/tracking` is your eyes on the fleet. It shows every truck currently on a load, their position updating in real time, and what they're doing.

Opening the map

Sidebar → **Tracking**. The map loads centered on your fleet (usually a wide US view if trucks are scattered, zoomed in if they're clustered).

What you see

Each truck on the road appears as a **blue marker** at its current GPS position. As the driver moves, the marker glides smoothly to the new position instead of jumping — easier to read at a glance.

Click any marker to see:

- **Driver name** and truck unit number.

- **Current speed** (if available).
- **Last update time.**
- **Load ID** they're working.
- **Link to the load detail.**

You'll also see, for the currently-selected truck:

- **Green pin** — pickup origin.
- **Red pin** — destination.
- **Orange dashed line** — the path the driver has already traveled.
- **Blue solid line** — the remaining route to destination.

This gives you a story: where they started, where they are, where they're going.

Reading the map

A few patterns worth recognizing:

Driver moving smoothly along a highway. Everything's normal. The blue line shows their progress matches the planned route.

Driver stopped for an extended time. Either parked (truck stop, rest area, on-duty break), at the pickup waiting, or at delivery. Click the marker for context.

Driver moving slowly in a city. Yard congestion, urban traffic, or close to a pickup/delivery. Normal.

Driver going off-route. Could be deliberate (fuel stop, detour around closure, personal break) or accidental (wrong turn). Worth a message if it persists.

Driver hasn't moved in a long time but isn't at a stop. Could mean: stopped to address an issue, signal dropped (the position is the last known), or something's gone wrong. Message them.

Marker is dim or shows old timestamp. The driver's position hasn't updated recently. Phone is offline, signal is bad, or the tab was closed. Wait a minute; if it doesn't refresh, message them.

ETA estimation

For each active load, the system calculates an ETA at the destination based on the driver's current position, route, and average speed. Click a load (or its truck marker) to see the ETA.

The ETA is compared to the scheduled delivery appointment to flag:

- **On time** — green indicator.
- **Delayed** — red indicator.

When a load goes from on-time to delayed, you'll see a notification. That's your cue to either message the driver about a delay or — if you can do something — speed things up.

Multiple trucks at once

Looking at the whole fleet:

- All markers visible at once. Zoom in to see clustered trucks separately.
- Click any to see its details panel.
- If two drivers are at the same location (rare but happens), their markers may overlap. Zoom in to separate.

You can also drag the map to focus on a region (a single state, a city, the bottom of a long route).

When the map looks wrong

A few cases:

A truck appears in the wrong place. Could be:

- GPS error (especially in urban canyons or after long indoor stretches).
- The driver tab is closed and the position is stale.
- The driver swapped phones and the new one hasn't reported yet.

Message the driver: "Where are you actually?" Their answer plus their position confirm or fix the picture.

A truck doesn't appear at all. They haven't reported GPS recently. Possibilities:

- Tab is closed.
- Phone is off.
- Signal is bad in their area.
- They forgot to grant location permission.

Message them to confirm they're online.

The route line goes through impossible places. The route is calculated by Google Maps; sometimes it picks an odd path. The truck is following whatever GPS unit they're using, not necessarily the LogisX-rendered route. The route line is a guide, not a turn-by-turn instruction.

What dispatch can do from the map

Beyond viewing, the map is also actionable:

- **Click a truck** → **click the load link** → opens the load detail, where you can update status, reassign, or take any other action.
- **Right-click a truck** (on desktop) → quick options menu (varies by platform).

When to look at the map

Throughout the day:

- **Morning** to confirm overnight drivers ended up where you expected.
- **Mid-day** to spot anything unusual.
- **Before answering broker calls** so you can give an accurate position.

You don't need to stare at the map all day. The notifications and dashboard surface what needs attention. The map is for the deeper "what's going on with X" questions.

The customer tracking link

The same map data drives the public customer tracker. When you share a load's tracking URL with a broker or shipper:

- They see a simplified view (status, ETA, last known position).
- They don't see other trucks, driver names, or financial info.
- They can refresh it freely (rate-limited but generous).

This is the easiest way to defuse a "where is my load?" call from a broker — send them the link and let them watch.

Pro tips

- **Refresh if the map looks stale.** Most of the time it's live, but a long open tab can drift.

- **Filter by load if you only care about one.** Click the load on Active Loads → its detail view shows the same tracking with focus on just that truck.
- **Zoom out before sharing your screen.** If you're presenting to leadership, show the whole fleet first, then zoom in for specifics.
- **Use it as a sanity check before approving anything.** If a driver claims to be in Atlanta and the map shows them in Birmingham, you have a question.

When the map is wrong about a driver

GPS isn't perfect. If a driver disputes their position on the map ("I'm at the receiver, not parked at the gas station"), they're usually right. Trust the driver's voice over the map's last data point. The map is a tool; the driver is in the truck.

Status Management

Most status changes happen automatically through the geofence as drivers arrive at and leave locations. But the geofence isn't perfect, and you'll sometimes need to step in to correct or advance a status manually from the dispatcher side.

The status flow

Every load progresses through this sequence:

```
Dispatched → Accepted → At Shipper → Loading → In Transit  
→ At Receiver → Unloading → Delivered → POD Received
```

Not every load uses every step. Some shippers skip Loading; some receivers skip Unloading. The order is fixed.

When auto-update misses

The geofence is a ~500-meter circle around pickup and dropoff. Misses are common in:

- **Urban areas** with weak GPS.
- **Indoor docks** — driver pulls into a steel building, GPS dies.
- **Imprecise addresses** — the address in the sheet is off from where they actually park.
- **Adjacent locations** — gas station, truck stop, scale next to the actual location.

When it misses, you'll see a driver who should be at At Receiver still showing In Transit. The driver may or may not have updated manually.

Updating from the dispatcher side

You can update any load's status without waiting for the driver:

1. **Open the load.** From Active Loads tab, click the load.
2. **Find the Status dropdown** in the detail view.
3. **Change to the new status.**
4. **Save.**

The change is logged. The driver sees the new status on their phone immediately.

When to do this:

- **Driver tells you on the phone they've arrived.** They may be between GPS reports; you can update on their behalf.
- **The geofence missed.** They're physically there but auto didn't trigger.
- **The geofence misfired.** They drove through a geofence and the system auto-advanced; you can correct back.

The "valid predecessor" check

Status updates enforce a sanity check. You can't jump from At Shipper straight to At Receiver without passing through In Transit. Trying to skip steps returns an error.

This is intentional. Out-of-order statuses confuse downstream systems (customer tracker, invoices, financial calculations).

If you genuinely need to skip a step (rare, but it happens — e.g., a load that bypassed a checkpoint), make the intermediate transition manually. The audit trail will show what you did.

The "one active job" rule

A driver can have **only one load in an active state** (At Shipper, Loading, In Transit, At Receiver) at a time. The status update endpoint returns a 409 Conflict if you try to put a driver in an active status while another load is already active.

This protects against physical impossibility. You can't be at two pickups at once.

If you hit this on a status update, check which other load is in an active state. Usually it's a stale load that needs to be finalized first.

Backwards updates

The dispatcher UI lets you move a status backwards as well as forwards. Examples:

- **Mis-advance correction.** Auto-advanced to At Receiver because the driver passed the geofence; correct back to In Transit.
- **POD upload mistake.** Driver uploaded a wrong file and re-uploaded the right one; status doesn't need to change.

- **Driver returns to pickup.** A receiver refuses the load; driver returns to shipper for re-delivery. Backwards from At Receiver to In Transit makes sense.

Backwards changes are logged the same as forward changes.

Logging reasons

When you (or a driver) change status manually, the system asks for a brief reason. Examples:

- "Geofence missed at pickup"
- "Driver arrived per phone confirmation"
- "Corrected after misfire"
- "Receiver refused, returning to shipper"

Be specific enough that someone reading the log later understands what happened. A vague "manual update" is fine if there's no story behind it, but a concrete reason helps with audits and dispute resolution.

Status Logs sheet

Every status change — auto or manual, by driver or dispatcher — writes to the "Status Logs" sheet in the backend. The sheet has:

- Timestamp.
- Load ID.
- Old status → new status.
- Reason given.
- Who made the change.

Super Admin can read the full logs. If you're trying to understand a load's history, that's the source of truth.

When to update aggressively vs. let it ride

Some dispatchers update aggressively (every status change confirmed within minutes). Others wait and only intervene when something looks stuck.

Lean toward aggressive when:

- The load has a tight delivery window.

- The broker is calling for updates.
- The customer is using the public tracker.

Lean toward letting it ride when:

- The load is on a long haul with plenty of time.
- The driver is reliable and you trust their auto-updates.
- You have other things needing attention.

There's no rule. Use judgment.

Geofence trigger notifications

Every geofence event — auto-advance, manual update, status logs — fires a real-time notification:

- **Dispatcher Notifications tab** shows the event.
- **Driver app** shows it as a status change.
- **Customer tracker** updates if the load is being tracked.

If you see a status change you didn't expect, click the notification to see the load and check whether anything is wrong.

Diagnosing a stuck status

If a load's status seems stuck (driver clearly at the receiver but status is still In Transit, hours later):

1. **Is the driver's app open?** Check tracking map — does their dot show recent position?
2. **Did the geofence miss?** Some addresses are slightly off. Check the geocoded pickup/dropoff in the sheet.
3. **Did the driver decline to update?** They may have forgotten or been busy unloading.
4. **Is there a bigger issue?** Driver may have been pulled off duty, broken down, or had an incident.

Message the driver. The fastest fix is usually to ask.

Special status: "Cancelled"

A cancelled load has its status set to **Cancelled**. This is a Super Admin action — you can't do it from the dispatcher side.

Per the 2026-04-19 client decision, dispatchers don't have cancel authority. If a load needs to be cancelled outright, escalate to Super Admin. They'll handle it.

If you just need to swap drivers, reassign instead. That's a different action and works without cancellation.

Pro tips

- **Update status when you talk to a driver.** If they call to say they've arrived, update before you hang up. Eliminates confusion.
- **Trust auto-updates by default.** They're right 80% of the time. Only override when you have specific information.
- **Don't manually advance past where the driver actually is.** Tempting on a long-haul to advance to "At Receiver" when they're still 30 min out. Don't — the customer tracker shows the status and "At Receiver" when actually not is misleading.
- **Use the Status Logs sheet for disputes.** If a driver claims to have done X and you don't see it on the load, check the logs.

Expenses

Drivers log expenses (fuel, tolls, repairs, lumpers, scale tickets, etc.) on their phones throughout the day. You see them on the **Expenses** screen, review them in context, and can log on a driver's behalf when needed. Approval itself is a Super Admin action — you see the data and surface issues.

Opening expenses

Sidebar → **Expenses**. You'll see a list of all expense submissions across the fleet, most recent first. Each row shows:

- **Date** of the expense.
- **Driver** who logged it.
- **Type** (Fuel, Repair, Toll, Scale, Lumper, etc.).
- **Amount**.
- **Vendor** (where they paid).
- **Load ID** the expense is associated with.
- **Status** — Pending, Approved, Rejected.

You can also click into a row for the full detail, including the receipt photo, the auto-parsed values from OCR, and the driver's description.

Reviewing submissions

What dispatchers typically look at:

- **Does the amount match what's expected for that vendor and type?** A \$400 fuel charge at a truck stop on a long haul is normal; the same amount for a lumper is unusual.
- **Is the receipt photo readable?** If you can't read it, the expense may not be approvable.
- **Is the Load ID right?** If the expense is associated with a different load than expected, the financial allocation will be off.
- **For fuel:** are gallons and odometer logged? If not, the analytics suffer.

If something looks off, **message the driver** to clarify before escalating. Many issues are simple data-entry mistakes the driver will gladly fix.

What you can't do directly

You **can't approve or reject** expenses. That's a Super Admin action. What you can do:

- **Add notes** for Super Admin to see.
- **Message Super Admin** to flag specific submissions.
- **Identify patterns** worth reviewing (a driver fueling more than expected, repeated lumpers fees, etc.).

In practice, the workflow is: drivers submit, you review and flag issues, Super Admin processes the approvals. You're not in the approval chain — you're in the quality-check chain.

Adding an expense on a driver's behalf

Sometimes a driver pays for something by phone and tells you about it instead of logging it themselves:

- "Hey, the tire repair shop only takes phone payments and I authorized \$300."
- "Just paid the lumpers \$80 cash; can you log it for me?"
- "I forgot to log fuel from yesterday."

To add on their behalf:

1. **Expenses → Add Expense.**
2. **Pick the driver from the dropdown.**
3. **Fill in the form** — type, amount, date, vendor, description, Load ID.
4. **Photo** (if you have a receipt).
5. **Save.**

The expense appears in the system as if the driver logged it, with a small indicator showing "added by dispatch." That indicator is informational — it doesn't change the approval workflow.

Expense types and what they mean

The expense Type field is structured. Choose the closest match:

TYPE	USE FOR
Fuel	Diesel, DEF. Gallons and odometer fields appear.
Repair	Tire, brake, mechanical work, anything emergency-fix.
Toll	Manual toll payments (not automatic E-ZPass which is billed separately).
Scale	Weighing fees at CAT scales or others.
Lumper	Payments to dock workers.
Wash	Reefer or tanker washouts.
Parking	Paid overnight or longer parking.
Permit	Overweight, oversize, single-trip permits.
Other	Anything that doesn't fit. Use the description to clarify.

When in doubt, **Other** with a clear description is fine. Super Admin will recategorize if needed.

Fuel analytics

Fuel is the biggest expense category and has dedicated analytics. From the Expenses tab (or via Super Admin), you can see:

- **Total fuel spend** for a period.
- **Cost per gallon** (avg).
- **Monthly trend**.
- **Per-driver breakdown** — which drivers are buying more fuel per mile.

Useful for spotting:

- A driver suddenly fueling much more often (could be a truck issue or a driver issue).
- Vendor patterns — are drivers buying at expensive truck stops when cheaper ones are on the route?
- Seasonal trends.

You don't typically act on fuel analytics yourself — Super Admin does. But you may be asked to investigate something the analytics surface.

When a driver disputes a rejection

If Super Admin rejects an expense, the driver will see a "rejected" status on their side and (typically) a reason. Common rejection reasons:

- **No receipt.**
- **Receipt unreadable.**
- **Personal expense miscategorized as company.**
- **Duplicate** (same fuel stop logged twice).
- **Wrong load attribution.**

If a driver thinks the rejection is unfair, they message you. Your role: hear them out, talk to Super Admin, mediate. If the rejection stands, communicate that to the driver clearly. If it's reversible, ask Super Admin to reconsider.

Patterns to watch for

A few things worth flagging if you notice them:

- **Same driver, multiple lumpers on consecutive days.** Lumpers are sometimes scams; if a driver is paying them frequently, ask about the receivers.
- **Fuel receipts at truck stops far from the route.** Could be a deadhead, a personal stop, or something else. Ask.
- **Unusually high repair amounts.** Even normal mechanical issues should be in the hundreds, not thousands, without notice.
- **Mass receipts within a tight window.** Could be a driver catching up on logging. Fine, but verify load IDs are correct.

Most patterns turn out to be innocent. The point is to look — patterns invisible to the driver may be visible to you.

Best practices

- **Glance at expenses daily.** A 2-minute scan of the day's submissions catches issues early.
- **Don't ignore the photo.** It's the proof. Open a few each day to make sure they're legible.
- **Talk to drivers, not at them.** "Hey, can you help me understand this \$400 repair?" lands better than "Why is this so high?"

- **Encourage logging at the time of purchase.** Drivers who log on the day of are way more accurate than drivers who reconstruct a week.
- **Use the AI's auto-fill but don't trust it blindly.** Receipt OCR is good, not perfect. Verify.

Messaging Drivers

The Messages screen is the day-to-day communication channel with every driver in your fleet. This chapter is how to use it well.

Opening Messages

Sidebar → **Messages**. You'll see a list of conversations, one per driver. Each entry shows:

- Driver name.
- Last message preview.
- Unread count badge.
- Timestamp of last activity.

Click a conversation to open the chat thread.

The chat interface

Standard chat layout:

- **Driver's messages** appear on the left.
- **Your messages** on the right.
- **Timestamp** for each message.
- **Read indicator** — you can see whether the driver has read your latest.
- **Message box** at the bottom — type and tap Send.
- **Attachment** (paperclip icon) — for photos.

Conversations are live. New messages appear without refreshing.

Per-load messaging

Each load also has its own message thread, scoped to that load. From the Active Loads tab → click a load → there's a Messages section within the load detail. Messages sent there appear in:

- The load's thread (visible to driver from their load detail).
- The driver's general thread (visible to you in Messages).

This dual-threading is intentional. You can have a load-specific conversation that's easy to find later, while still having the broader driver thread for context.

Use load threads when:

- The conversation is about a specific load (rate dispute, dock issue, ETA update).
- You want the conversation searchable by load later.

Use the general thread for:

- General dispatching ("I'm available", "going off duty", "headed home").
- Cross-load issues.

What dispatchers message about

A lot of typical reasons:

- **"Are you available for a load?"** Before assigning a non-routine load.
- **"Confirm pickup at 7AM"** when the driver hasn't acknowledged the assignment.
- **"Receiver wants you to call before arriving"** — specific instructions from a broker.
- **"Where are you?"** — when GPS shows them in an unexpected place.
- **"Need an updated ETA for the broker."**
- **"Thanks for the smooth delivery."** — positive feedback. Don't skip this.

Tone and conventions

Same general rules as any work chat:

- **Be clear.** "Need ETA for LD-3492 ASAP for broker call" beats "what's your eta."
- **Be respectful.** Drivers are professionals. Treat them like it.
- **Be timely.** Same-day responses are the norm. Don't ghost.
- **Use Load IDs.** "LD-3492" is more useful than "the Chicago load."
- **Use names.** "Hey Marcus" is friendlier than "Driver."

A few specific patterns:

- **End-of-shift check-ins.** "How'd today go?" Doesn't take much; drivers appreciate it.
- **Pre-assignment briefings.** "Got a 600-mile pickup tomorrow morning, you good?" Better than just dispatching it blind.

- **Damage reporting.** If a driver photographs damage, acknowledge: "Thanks, I'll let the broker know."

Photo attachments

Tap the paperclip icon to attach a photo. Useful for:

- **Receiver's rate confirmation** — sometimes you need to share an updated rate con.
- **Lot diagrams** — if a receiver has a complicated approach, photo it.
- **Damage** — share a photo of damage with the driver who's about to pick up so they know what to look for.

Avoid sending memes, jokes, or non-work photos. Drivers expect professionalism on the work channel.

Bulk announcements

Sometimes you need to message multiple drivers about the same thing — a holiday schedule, a policy update, a broker change. Right now there's no built-in broadcast feature. Options:

1. **Send to each driver individually.** Tedious but reliable.
2. **Use email** — for drivers with current email addresses on file.
3. **Ask Super Admin** to send an in-app announcement (they have the tools).

For routine bulk communication, email or text outside the app is usually faster.

What drivers see

When you send a message:

- **Their phone shows a badge** on the Messages tab next to the unread count.
- **A banner appears briefly** at the top of their screen if they have the app open.
- **No OS-level push notification** — the app runs in the browser and doesn't have that capability.

In practice, drivers check the app periodically. Same-day response is the norm. Faster than that depends on whether they're driving (they shouldn't be reading messages mid-drive).

Search and history

You can search within a conversation for specific terms or load IDs. The full message history is preserved — nothing is deleted.

If you need to recover a message from weeks ago, scroll up. If the conversation is very long, the app loads older messages on scroll.

Privacy and audit

Every message is stored in the database:

- **You** see your conversations.
- **Drivers** see their conversations.
- **Super Admin** can read all conversations for audit purposes.

This isn't a private channel between you and the driver — it's a work channel. Treat it accordingly. Don't share personal info, don't badmouth others, don't put anything in writing you wouldn't want leadership to see.

When messaging isn't enough

Some situations need a phone call, not a message:

- **Emergencies.** Don't message about a hospital visit; call.
- **Complicated coordination.** Reassignment hand-offs, especially.
- **Sensitive conversations.** Performance issues, disagreements.
- **Anything where back-and-forth typing would waste time.**

Both you and the driver have phone numbers on file. Use them when the situation calls for it.

After-hours coverage

If your company has after-hours coverage (one dispatcher rotating overnight), the messaging continues to work. The on-duty dispatcher sees and responds to messages.

When you're going off duty, message your drivers proactively: "I'm out till 7 AM tomorrow; for anything urgent overnight, call the after-hours line at XXX-XXX-XXXX or message and someone will respond."

Pro tips

- **Pin urgent messages.** If you have a driver who's been silent and you've messaged them about something time-sensitive, follow up with a brief call. Don't let it sit.
- **Don't multi-thread for the same issue.** If you're talking about LD-3492 in both the load thread and the general thread, you'll lose track. Pick one and stick with it.
- **Read receipts matter.** If you sent something important and the driver hasn't read it in 30 minutes, follow up or call.
- **Acknowledge driver messages quickly.** Even a "got it, let me check" buys you peace and shows you're paying attention.

Customer Tracking Links

Every active load has a public tracking URL that brokers and shippers can use to follow the load themselves. This chapter is how to share it and what they see.

What the public tracker is

The public tracker is a customer-facing page at `app.logisx.com/track/<LoadID>` that shows the status of a single load to anyone who knows the Load ID. No login required.

This solves the constant "where is my load?" calls from brokers. Send them the URL once and they can check whenever they want.

What the customer sees

When a broker or shipper opens the tracker for a load, they see:

- **Current load status** — Dispatched, In Transit, At Receiver, Delivered, etc.
- **Driver's last known location** on a map (redacted to "stale" if no update in 2+ hours).
- **ETA** at destination, with on-time or delayed indicator.
- **Pickup and delivery addresses** — city, state, ZIP.
- **Truck unit number** — useful for security at delivery sites.

What they **don't** see:

- **Driver name.** Hidden.
- **Driver phone.** Hidden.
- **Broker name** (yours or anyone else's).
- **Rate or any financial info.**
- **Internal notes from dispatch.**

This is a deliberate whitelist. The page exposes only what's appropriate for customer eyes.

Sharing the link

For each load:

1. **Open the load** from Active Loads.
2. **Click the Copy tracking link button** in the detail view.
3. **Paste into an email, text message, or chat** to the broker or shipper.

The link looks like `https://app.logisx.com/track/LD-3492`. You can shorten it via a URL shortener if you want, but it's already pretty clean.

Once shared, the customer can refresh it freely. The page is rate-limited but the limit is generous (60 requests per 15 minutes per browser) — they can refresh as often as they want during a delivery.

When to share the link

Two scenarios:

Proactively at booking. When you accept a load from a broker, include the tracking link in your confirmation email. The broker can pass it to the customer. Fewer "where is my load?" calls.

Reactively on demand. When a broker calls asking for status, give them the link. "I'll text you a link you can refresh." Sets you up for fewer future calls about the same load.

Either way, the link is one of your easiest tools for reducing repetitive customer calls.

What if the customer reports the page is broken

A few things to check:

"Load not found." They typed the Load ID wrong. Confirm the Load ID with them and re-send the link.

"The map isn't loading." Could be a Google Maps API issue (rare) or their browser. Have them try a different browser; refresh.

"The status is stale." The driver's phone isn't reporting. Either they're indoors with no signal, or they've closed the tab. The tracker shows "last known position" with a timestamp — if it's been hours, the customer is right to be concerned. Investigate and update them.

"It's showing 'Delivered' but I haven't received it." Either the geofence misfired (driver was near but not at the receiver), or the load was delivered to the wrong location. Investigate immediately.

What you can't do via the tracker

The tracker is read-only. There's no:

- **Customer login** to leave notes.
- **Reschedule button.**
- **Driver contact button.**
- **Two-way communication.**

Anything the customer wants to do beyond watching has to go through you. That's intentional — the customer doesn't have an account, so they have no way to authenticate any action.

Internal preview

You can preview what the customer sees yourself, even while logged in. Just navigate to `/track/<LoadID>` in your own browser. The same page renders. You see the customer-facing view exactly as they'd see it.

This is useful when:

- **Verifying what the customer sees** before sharing.
- **Troubleshooting** when a customer reports something looking wrong.
- **Demo'ing** the tracker to a new broker or shipper.

Privacy

A few practical points:

- **The Load ID is the only credential.** Anyone with the URL can view. Treat Load IDs as semi-public — they're shared with brokers, drivers, and customers as part of normal business.
- **No PII leaks.** Driver name, phone, broker info, rate — none of it is on the public page. Even if the URL is shared widely, no sensitive data is exposed.
- **Search engines won't index it.** The page sets `X-Robots-Tag: noindex, nofollow`, so it won't appear in Google search results.
- **Rate limited.** A bad actor can't scrape every Load ID in sequence — the rate limiter kicks in. (And even if they did, they'd only get city-level position and status, nothing sensitive.)

Brokers who hate it

Some brokers will say "just call me with updates instead of sending a link." Fine. Some prefer phone. The link is a tool, not a mandate.

Other brokers love it and will start asking for tracking links automatically. Have your copy-and-paste workflow ready.

A few specific use cases

Multi-stop loads. The tracker shows current status of the load as a whole. Mid-trip stops (a multi-pickup or multi-drop) aren't called out separately. If a customer needs per-stop visibility, you'll have to message them with each update.

Loads with overnight stops. When a driver parks for the night, the tracker shows the last known position (the truck stop). The next morning when they start moving, the tracker updates.

Loads with reefer monitoring. The LogisX tracker doesn't currently show reefer temperature. If a customer needs that, route to your reefer monitoring vendor (separate system).

Loads with security escort. Some high-value loads have specific tracking requirements. The standard tracker is usually enough; if not, route to specialized tools.

Pro tips

- **Send the link in your booking confirmation.** Set the expectation early.
- **Use the customer view yourself.** Once a day, glance at the customer tracker for an active load. It catches things you might not see in the dispatcher view (a stale position, a status that hasn't moved).
- **Don't send the dashboard URL by accident.** `app.logisx.com/dashboard` would prompt a login — useless for the customer. Always copy from the **Copy tracking link** button.
- **For repeat customers, the same Load ID format.** Some brokers ask for ID formatting consistency. Confirm with them at the start of the relationship.

Notifications

The Notifications tab is the catch-all alert feed. Every system-generated event that involves dispatch lands here in reverse chronological order. This chapter is how to use it without drowning in it.

What ends up in Notifications

The full list:

- **New load arrived** (from n8n broker email parsing).
- **Load assigned** (when you assigned a load — yes, your own actions log here).
- **Driver accepted a load.**
- **Driver declined a load.**
- **Load reassigned** (driver swap).
- **Load cancelled** (Super Admin action).
- **Load soft-deleted** (Super Admin action).
- **Status updated** (auto-advance or manual).
- **Geofence triggered.**
- **POD uploaded.**
- **Expense submitted.**
- **Expense approved/rejected** (Super Admin action).
- **Driver location update** (selective — typically only when there's a significant event like loss of signal).
- **New message** received from a driver.

Each notification is a row showing:

- **Type** (icon + label).
- **Description** of what happened.
- **Driver** or **load** involved.
- **Timestamp.**
- **Click target** — clicking the notification typically opens the relevant load.

Reading the feed

The feed updates in real time. New events appear at the top. Read notifications are visually distinct from unread.

Patterns to recognize:

- **A burst of "new load arrived" early in the morning** — brokers sent rate confirmations overnight; n8n processed them in batch.
- **A pair of "load assigned" + "driver accepted"** within minutes — normal assignment flow.
- **A "driver declined" without a follow-up reassignment** — a load needing your attention.
- **A "POD uploaded" near the end of the day** — load nearing closure.

Clicking through

Every notification with a load ID is clickable. Click → dashboard switches to Active Loads tab and opens that load's detail modal. From there you can take whatever action the notification implies.

This deep-linking is one of the most useful workflow shortcuts. Don't read a notification, then go hunt the load — just click.

When to clear vs. when to leave

Notifications don't really get "cleared" — they stay in the feed for the historical record. Reading them marks them as read, but they remain.

Some dispatchers mark all as read at the end of each day. Some don't bother. Either is fine.

Filtering

The feed currently doesn't have built-in filters by type or driver. You see everything mixed together.

If you need to filter:

- **Search bar** at the top of the feed accepts driver names, load IDs, and keywords.
- **Browser Ctrl+F** works as a quick filter for visible items.

For deeper analysis (which is rare), Super Admin has the audit trail tool.

When notifications surface a problem

The feed is most useful when something has gone wrong. Examples:

"Status updated to At Receiver" for a load you don't recognize. Could be a geofence misfire. Click through, verify, correct if needed.

Multiple "expense submitted" from one driver in a tight window. They're catching up on receipts. Worth a glance to make sure they look right.

"Driver declined" with no follow-up assignment. Someone needs to pick this up. Reassign or escalate.

"Load cancelled" you didn't initiate. A Super Admin cancelled it; the notification typically includes who and why.

When to call vs. follow up via Notifications

A notification is information, not necessarily action. Most notifications are informational. A handful prompt action:

NOTIFICATION	ACTION
New load arrived	Add to your queue, assign when ready
Driver declined	Reassign
Status auto-advanced but seems wrong	Investigate, correct
POD uploaded	None usually — load is moving toward closure
Driver location lost	Check whether they're online, message
Expense submitted	Review when you have time

End-of-day scan

A useful habit: at end of day (or end of shift), scan back through the day's notifications. Look for:

- **Any "declined" with no follow-up.** Loose ends.
- **Any "status updated" by anyone other than the driver or auto.** Manual updates from dispatchers or admins — was the reason clear?
- **Anything else that surprises you.** A pattern you hadn't noticed.

A 5-minute scan catches things that slipped during the busy parts of the day.

When the feed is overwhelming

On busy days, the feed can scroll fast. Notifications you really need to act on get drowned by routine ones.

Three coping strategies:

1. **Focus on the dashboard, not the feed.** The Active Loads tab shows you what's actively in motion. The feed is the historical view; the dashboard is operational view.
2. **Use search.** Type a driver name or Load ID to filter the feed.
3. **Skip routine notifications.** "Status auto-advanced" for a load that's going smoothly doesn't need your attention. Glance and move on.

Notifications and the audit trail

Notifications are user-facing summaries. The full audit trail (Super Admin only) has more detail — what changed exactly, who initiated, what the previous value was.

If you need to research something deeper than the Notification text shows, ask Super Admin to pull the audit trail entry.

A few things Notifications won't tell you

- **Slack/email messages about the system.** Outside the app.
- **System errors or downtime.** You'd find out from leadership, not the feed.
- **Customer-side activity on the public tracker.** You don't see who looked at a load's tracking page.
- **Background jobs.** The Routemate sync, geocode cache refresh, etc. — invisible to the dispatcher.

For all of those, ask Super Admin or technical support.

Pro tips

- **Glance every 15–30 minutes during active hours.** Faster than that is overkill; slower lets things accumulate.

- **Use the feed as a "what just happened" log when something looks weird.** A driver's status is wrong? Scroll the feed for the recent status changes.
- **Don't rely on the feed for active management.** The Active Loads tab is your real-time view; Notifications is the log.
- **Acknowledge dramatic events.** If a notification surfaces a real problem, send a message to confirm action — driver acceptance, broker update, etc.

Fleet View

The Fleet tab on the dashboard and the sidebar items for Trucks and Trailers give you visibility into the equipment. This chapter is how to read those views and what dispatchers typically use them for.

The Fleet tab on the dashboard

From the operations dashboard, the **Fleet** tab shows trucks and their current state. Each truck card includes:

- **Truck unit number** (e.g., **TRK-101**).
- **Make, model, year.**
- **Status** — Active (assigned to a driver and on a load), Available (idle, no load), Maintenance.
- **Currently-assigned driver** (if any).
- **Last known location** (city, state).

This is your fleet at a glance. At any moment you can see how many trucks are working, how many are idle, and where everyone roughly is.

The Trucks page

Sidebar → **Trucks**. A more detailed view of every truck in the fleet, sortable and searchable. For each truck:

- The fields above, plus:
- **VIN.**
- **License plate.**
- **Year, make, model.**
- **Owner ID** (which investor owns it, if applicable).
- **Documents** — registration, insurance, inspection (you can view).

Filters let you focus on a subset — active vs. idle, specific make, specific owner.

The Trailers page

Sidebar → **Trailers**. Same general format but for trailers (van, reefer, flatbed, etc.). Useful when assigning a load that needs specific equipment.

What dispatchers use Fleet for

A few common patterns:

"Who's available right now?" Open the Fleet tab. Scan for Available status. That's your assignment pool.

"Is Truck X idle? Should I reassign?" A truck idle for days may have a maintenance issue, the driver may be on vacation, or the truck may just not have had a load matching it. Worth checking.

"What truck is Driver X in?" Find the driver on the Fleet tab (they're attached to a truck card if active). Or use the Drivers page (Super Admin) which shows the full driver-to-truck mapping.

"Where's TRK-101 right now?" Open the Fleet tab and find TRK-101. The card shows last known location. For real-time position, switch to the Tracking map.

What dispatchers don't typically do

Most truck and trailer edits are Super Admin actions:

- **Adding a new truck** to the fleet.
- **Removing a truck** (sold, scrapped).
- **Changing truck ownership** (owner_id).
- **Updating fixed cost fields** (insurance, ELD, IRP, etc.).
- **Uploading new documents** (registration renewal, etc.).
- **Setting the driver-visible flag** on a document.

You can view all of those, but editing is restricted. If you need a change, ask Super Admin.

Truck-driver assignment

Trucks have a single assigned driver at a time. This is the driver who currently uses that truck day to day. Changes:

- A new hire gets assigned a truck during onboarding.
- A driver leaves the company; their truck is unassigned until reassignment.
- A truck goes into maintenance; the driver may be moved to a backup truck temporarily.

You see the current assignment in Fleet. To change the assignment, ask Super Admin.

The driver-visible flag

Trucks have documents (registration, insurance card, inspection certificate). Some are flagged "driver-visible" — those appear in the driver's Kit tab on their phone.

Common documents flagged driver-visible:

- Registration.
- Insurance card.
- Annual inspection.
- Cab card / IRP.
- HVUT Schedule 1.

Documents flagged for internal use only (not driver-visible):

- Lease agreements.
- Sale contracts.
- Internal maintenance records.

If a driver tells you "I need to show my registration but it's not on my phone," check Trucks → that truck → Documents. The doc may exist but not be flagged driver-visible. Ask Super Admin to toggle it.

Searching the Trucks page

The search bar at the top of the Trucks page accepts:

- **Unit number** (TRK-101).
- **VIN** (or partial VIN).
- **License plate**.
- **Driver name** (current assignment).
- **Make** (Freightliner, Kenworth, etc.).

Most of the time you'll search by unit number or driver name.

Trailers vs. Trucks

The Trailers page is structurally similar. Each trailer card shows:

- Trailer ID.
- Type (van, reefer, flatbed).
- Status.
- Length.
- Owner.

Trailers may or may not be assigned to specific drivers — depends on your company's structure. Some carriers have dedicated trailer pools; others trade trailers between drivers as needed.

When trucks need maintenance

If a driver reports an issue:

1. **Note the issue** in the truck record (via notes field if available, otherwise log to messages).
2. **If maintenance is scheduled**, change the truck's status to **Maintenance** so it's not assigned new loads. (This is a Super Admin action; you may need to ask.)
3. **Coordinate the repair shop** with the driver.
4. **Move the driver to a backup truck** if available.

LogisX doesn't have a full-fledged maintenance tracking system. Most fleets use a separate tool for that. The LogisX status is just enough to know "this truck shouldn't get a new load right now."

Fleet health KPIs

The dashboard's KPI cards may show fleet-related metrics:

- **Trucks on the road** — how many are actively running a load.
- **Trucks available** — how many are idle and could take a load.
- **Trucks in maintenance** — how many are unavailable.

These numbers update in real time. A high "available" count midday is a problem — you have capacity sitting idle.

When the fleet view doesn't match reality

A few things can cause discrepancies:

- **A truck was sold but not removed from the system.** It still shows up on the Fleet tab. Ask Super Admin to remove.
- **A driver was reassigned but the truck's assigned_driver field wasn't updated.** Same fix.
- **A truck is shown as Active but the driver has no current load.** Status updates can get out of sync. Refresh; if it persists, the load may have been cancelled without the truck status being updated. Investigate.

Pro tips

- **Use Fleet first thing in the morning.** Confirm everyone's where you expect.
- **Check Available trucks before opening Job Board.** If you have no available trucks, the job board work is academic.
- **Verify documents before each load.** If a truck has an expired registration, you've got a problem — and a load you can't run on that truck.
- **Note quirks per truck.** Some trucks have specific equipment quirks (low fifth wheel, weight distribution, etc.) that matter when matching to loads. The system doesn't track that; your memory does.

Dispatcher Best Practices

The unwritten rules. What separates good dispatchers from great ones.

Communication

Be responsive. Drivers and brokers expect same-day responses. 30 minutes is normal during business hours; an hour is the upper bound. Longer than that, you owe an explanation.

Be proactive. Don't wait for the broker to ask "where's my load?" — text them an update when you have one. A quick "driver is rolling, ETA on track" prevents a phone call.

Be brief but complete. Long messages tire out drivers. Short messages without context confuse them. Find the middle.

Use names. "Hey Marcus" beats "Hey Driver." Brokers and drivers notice when you remember them.

Use Load IDs. "LD-3492" is more precise than "the Chicago load." Always include it when there's any ambiguity.

Assignment

Match drivers to loads thoughtfully. Location, equipment, HOS, driver preference — all matter. The dropdown shows you available drivers; you choose.

Don't over-assign one driver. Spreading loads across the fleet keeps everyone happy. A driver who feels they get the worst loads will quit.

Honor driver preferences. If a driver tells you "I don't want overnight loads," try to respect that. The fleet has flexibility; use it.

Assign with context. When you assign a non-routine load, send a quick message: "Got a 600-mile pickup tomorrow morning, you good?" Better than dispatching blind.

Status discipline

Verify before manually advancing. Auto-update is usually right. Manual updates should be reserved for clear cases (driver phone confirmation, geofence miss).

Don't game the status. Advancing to "Delivered" because the broker is impatient and you want them off your back is dishonest. The status tracker is a record; tell the truth.

Correct quickly when wrong. A misfired status that you notice should be corrected within minutes, not hours. The customer tracker shows the status; stale wrong data damages credibility.

Working with drivers

Listen first. When a driver calls with a problem, hear them out before jumping to solutions. They often have context you don't.

Don't argue about HOS. If a driver says they don't have hours, they don't have hours. Plan around it. Pressuring drivers to violate HOS is illegal and unethical.

Respect home time. Drivers have lives. If a driver tells you they're going home Friday, don't try to slip a Saturday delivery onto their schedule.

Don't single out underperformers in front of others. Drivers talk. If you're addressing performance, do it privately.

Recognize good work. A simple "great job on that delivery" message takes 5 seconds and lasts in the driver's head for days.

Working with brokers

Set expectations early. When you book a load, confirm the delivery window in writing (email or rate con). Misunderstandings about times are the most common source of broker disputes.

Send tracking links proactively. It cuts the "where is my load?" calls by 80%.

Don't accept rate cons you can't fulfill. If you don't have an available driver for a load, decline upfront. Accepting and then scrambling is worse than declining.

Be honest about delays. "Driver hit construction, 30 min late" goes over better than silence followed by a missed appointment.

Don't badmouth other carriers. Even if a broker is venting about a competitor. Stay professional.

Daily habits

Morning glance. First thing: Job Board → Notifications → Tracking map. 5 minutes total.

Mid-day check-in. Around 11 AM and 2 PM, scan the dashboard. Address anything new.

End-of-day scan. Before clocking out: every active load has a current status, every recent delivery has a POD uploaded, no driver is dangling without instructions.

Per-load discipline. When you touch a load (assign, reassign, status update, message), close the loop: confirm the driver got the message, confirm the broker is informed if relevant.

Documentation

Note unusual things. If a delivery had a problem (damage, refused load, late arrival), make a brief note in the load's messages or notifications. Future-you (or your replacement) will thank you.

Use Load IDs consistently. In emails, in texts, in phone calls — always reference Load IDs. Reduces confusion.

Keep BOL photos. Even after the driver uploads POD, brokers sometimes ask for "the signed BOL." Have it findable.

Don't rely on memory. A small set of running mental notes (which drivers prefer what kinds of loads, which brokers are slow payers, which receivers are notoriously slow) is fine. A bigger set should be written down.

Decision-making

Defer to drivers on their own equipment and hours. They know their truck. They know their body. Don't override their judgment.

Defer to brokers on the rate. It was agreed at booking. Mid-load renegotiation rarely works and damages relationships.

Defer to Super Admin on policy. When in doubt about whether something is allowed (a specific cancellation reason, an unusual expense, a borderline driver behavior), ask. Better to confirm than to act and apologize.

Use your own judgment on operational details. Where to message vs. call. How to phrase a status update. Which driver gets a competitive load. That's your craft.

When things go wrong

Stay calm. Drivers and brokers will mirror your energy. A panicked dispatcher creates more panic.

Triage. Of the things going wrong right now, which actually need attention in the next 30 minutes? Handle those first.

Document. Even in the heat of the moment, log key facts. Memory blurs; written records don't.

Escalate appropriately. Some problems need Super Admin. Some need the broker. Some need leadership. Know who to call and call them.

Don't blame. When recapping a problem, focus on what happened and what to do next. Not who's at fault. Blame games burn bridges.

After hours

Hand off cleanly. If after-hours coverage exists, tell them what's outstanding before you go off duty.

Be available for emergencies. Drivers should know how to reach you (or whoever's covering) for a true emergency.

Don't drag the day into the night. Long hours burn dispatchers out. Set boundaries.

Career

Build relationships, not just transactions. The drivers you work with, the brokers you book with — these are long-term relationships. Treat them like it.

Learn the patterns. Every fleet has rhythms — busy days, slow days, broker seasons, equipment quirks. Pay attention.

Get to know the technology. The more you understand how the system works, the better you'll be at troubleshooting and the less time you'll spend on rote stuff.

Talk to other dispatchers. Whether at your company or others, peer dispatchers have stories and tricks. Listen.

A final word

Dispatch is a job that rewards consistency. Showing up, communicating clearly, handling exceptions calmly, doing the routine stuff routinely — that's what makes a fleet run. The drivers see it. The brokers see it. Leadership sees it.

The flashy moves (saving a load that's about to go sideways) get attention. The steady stuff (every load on time, every message answered) is what builds careers.

Troubleshooting

Common dispatch issues and how to resolve them.

Sign-in and access

"I can't sign in." Check caps lock. Verify the username (case-sensitive). After multiple failed attempts, the system temporarily blocks; wait 15 minutes. If still locked out, ask Super Admin to reset.

"I can see only my own loads, not the dashboard." Your role may have been changed. Check your profile — does it say Dispatcher? If not, ask Super Admin.

"The page is blank or shows an error." Refresh. Sign out and back in. Clear browser cache. If still broken, escalate.

Assignment problems

"A driver I want isn't in the dropdown." They're already on an active load. Check Active Loads to confirm.

"The driver doesn't have available status but Fleet shows them as Available." Refresh. If the discrepancy persists, ask Super Admin to investigate — there's probably a status update that hasn't synced.

"I assigned a load but it's not showing on the driver's phone." Check the driver's connection. They may have the tab closed. Message them to confirm and have them refresh.

"The driver hasn't accepted my assignment in 30 minutes." Try the tracking map — are they online? If offline, message and call. If online but unresponsive, they may have stepped away.

Job board issues

"New loads aren't appearing on the Job Board." Check the n8n workflow status (or ask Super Admin to). The workflow may have failed silently and loads are stuck in the broker email pipeline.

"A load is on the Job Board with wrong information (typo in city, wrong rate, etc.)." Could be a parsing error from n8n. Edit via Data Manager (or ask Super Admin). Re-verify with the broker.

"There's a duplicate load on the Job Board." Broker sent the rate con twice. Ask Super Admin to delete the duplicate.

Status problems

"A driver's status is stuck." First check whether their phone is online (Tracking map). If yes, message them. If no, the geofence missed and the driver isn't manually updating.

"Status auto-advanced when the driver isn't actually there." Geofence misfire. Update back to the previous status. Note the reason.

"Status is at At Receiver but the driver says they're at the wrong place." The geocoded delivery address may be off. Look at the load detail; if the address is wrong in the system, edit it (Data Manager).

"I can't change the status — it gives an error." The transition may be out of order (you tried to skip a step). Or another load is in an active state for this driver (one-active-job rule). Check both.

Tracking problems

"A truck isn't showing on the map." Their phone may have the tab closed, GPS denied, or signal lost. Message to confirm.

"A truck is in the wrong place." Either the GPS is glitchy or you have stale data. Refresh. If wrong info persists, the driver's GPS was off; have them refresh.

"The route line goes through impossible places." The route is from Google Maps, which sometimes picks weird paths. The truck itself is following their actual GPS, not the route line. Not a problem.

"The map is slow or doesn't load." Could be network. Refresh. Try a different browser if persistent.

POD upload issues

"A driver says they uploaded POD but I don't see it." Refresh the load. If still missing, the upload may have silently failed on their side. Ask them to retry.

"The POD photo is unreadable." Ask the driver to re-photograph and re-upload. Multiple uploads on the same load are fine — all are stored.

"The driver lost the BOL." Reach out to the receiver for an electronic copy. Or have the driver describe the delivery and document what they remember. Escalate to Super Admin if needed.

Expense issues

"A driver's expense list is empty but they say they logged things." Have them refresh. If still empty, check whether they're logged into the same account on multiple devices and ended up out of sync.

"An expense was auto-filled wrong by the OCR." Edit the values before approval. The OCR is a starting point, not the final word.

"A driver disputes a rejection." Talk to them, talk to Super Admin (who rejected it), find common ground. Reversibility is possible.

"Cash expenses without receipts." Log them with a clear description. Super Admin decides whether to approve. Anything reasonable usually gets approved.

Driver communication issues

"A driver isn't responding to messages." Check tracking — are they driving? If yes, they shouldn't read messages anyway. If parked and not responding for hours, call.

"A driver responded with something inappropriate." Document. Talk to them about it. Escalate to Super Admin if patterns develop.

"A driver is asking for help with something outside my scope." Refer them to the right person. Don't pretend you can help when you can't.

Customer tracking issues

"A customer says the tracker isn't showing updated info." Their browser may be caching. Suggest they clear cache or use a different browser. If the data on the dispatcher side is current, the public tracker should be too.

"A customer says the tracker shows the wrong status." Could be geofence misfire or your tracking has stale data. Verify against the driver's actual position.

"A broker complains the tracking link doesn't work." Verify they have the right URL (copy from the **Copy tracking link** button in the load). If they're using a different URL, that's the problem.

System-wide issues

"The dashboard is slow." Could be Google Sheets API rate-limit (the system caches but a cache miss is slower). Wait a minute, refresh.

"Notifications aren't appearing." Refresh. Check the Notifications tab directly. If the badge count is right but the feed is empty, sign out and back in.

"Everything looks weird and I'm not sure why." Sign out, sign back in. If still weird, escalate to Super Admin.

Edge cases

"A driver was reassigned mid-load. The old driver is still showing the load on their phone." Have them refresh. If still showing, sign out and back in.

"Two dispatchers are logged into the same account." Don't do this. Each dispatcher should have their own account.

"A load was deleted by Super Admin but it's still showing on the customer tracker." The tracker reads from the same source; if it's not updating, the customer's browser may be caching. Tell them to clear cache.

"A driver got two assignments for the same load somehow." Likely a re-assignment that didn't clean up. Ask Super Admin to investigate; the audit trail will show the sequence.

When you're truly stuck

If the troubleshooting above doesn't apply or doesn't resolve, escalate. Provide:

- **What you were trying to do** (the action).
- **What you saw instead** (a screenshot helps).
- **The Load ID, Driver name, and timestamp** involved.
- **Whether it's blocking your work right now** (priority signal).

Super Admin can pull deeper audit data, query the database directly, and resolve things you can't from the dispatcher view.

Reporting bugs vs. asking questions

Bug — the system did something wrong. Example: "I clicked Reassign and got an error message I've never seen."

Question — you're unsure how to use a feature correctly. Example: "How do I see a driver's full history?"

Both are valid escalations. Phrase the request honestly so the right person can help quickly.

Frequently Asked Questions

Common dispatcher questions, grouped roughly.

Access and accounts

Q. How do I sign in? Go to app.logisx.com. Enter your username (case-sensitive) and password. You'll land on the operations dashboard.

Q. Forgot my password. Ask Super Admin to reset it. There's no self-service reset.

Q. Can I have my account on multiple devices? Yes. Phone, tablet, desktop — all simultaneous. Same login.

Q. Will I see other dispatchers' actions? Yes. Every load shows the most recent activity regardless of which dispatcher took it. The Notifications tab shows all dispatch-related events.

Job board

Q. Where do new loads come from? Most arrive automatically from n8n parsing broker rate confirmation emails. Some are manually entered via the New Job button.

Q. Why is a load missing from the Job Board that should be there? Either n8n hasn't processed it yet (check email status), it's already been assigned (check Active Loads), or it was filtered out (cancelled, deleted).

Q. Can I edit a load on the Job Board? Some fields, yes — date, address, notes. Open the load detail and look for edit affordances. Rate and broker info usually require Data Manager (Super Admin) or n8n re-parsing.

Q. Can I assign multiple loads to one driver? No. A driver can have only one active load at a time (the system enforces "one active job" via status guards). Pre-assign future loads after current ones complete.

Assignments

Q. Why doesn't a driver show in the dropdown? They're already on an active load. Check Active Loads to confirm.

Q. Can I assign without the driver accepting? The assignment is created when you click Assign. The driver then accepts or declines. They have to act to either confirm or release.

Q. What if a driver declines? The load returns to the Job Board. Reassign to a different driver.

Q. How do I see a driver's load history? Sidebar → Drivers (Super Admin only for direct access). Or open a recent load, click the driver name. Some dispatchers ask Super Admin for the driver's load history report.

Status updates

Q. Why didn't the status auto-advance? Geofence missed. Common in urban or industrial areas. Manually update via the Status dropdown.

Q. Can I move a status backwards? Yes. The system allows status backwards-moves if you give a reason.

Q. Can I jump from At Shipper to At Receiver? No. Statuses must go in order. The system enforces this; you'll get an error if you try to skip.

Q. Why does the system say "another load is in an active state for this driver"? The one-active-job rule. A driver can have only one load in At Shipper / Loading / In Transit / At Receiver at a time. Resolve the other load first.

Tracking

Q. Why isn't a driver on the tracking map? Their phone may have the LogisX tab closed, GPS denied, or signal lost. Message them to confirm they're online.

Q. Can I see historical position data for a driver? The trail line on the map shows recent movement. For older history, ask Super Admin to query the driver_locations table.

Q. Is the ETA accurate? Reasonably so. It uses current position, speed, and route to estimate. ETAs get more accurate as the driver gets closer. Take with grain of salt 5+ hours out; trust within an hour.

Q. Can I share my screen with a broker? The customer tracking link is better. Click **Copy tracking link** on the load and send it.

Messaging

Q. Can I message multiple drivers at once? Not currently. Send individual messages.

Q. Are messages logged forever? Yes. Nothing is deleted. Super Admin can audit any conversation.

Q. Can I message brokers through the app? No. The Messages tab is dispatch-to-driver only. Broker communication is outside the app (email, phone).

Customer tracking

Q. What does the customer see? Status, last known position, ETA, pickup/dropoff cities, truck unit number. Not driver name, phone, broker, or rate.

Q. Is the tracker secure? The only credential is the Load ID itself. Without the Load ID, the URL is useless. The page is rate-limited and excluded from search engines.

Q. Can the customer leave a note? No. The page is read-only.

Q. When does the tracking link stop working? It works as long as the load record exists. Even after delivery, the page shows the final delivered status.

Expenses

Q. Can I approve an expense? No. Approval is Super Admin.

Q. Can I add an expense for a driver? Yes. Expenses → Add Expense → pick driver from dropdown.

Q. What about company fuel card transactions? Those happen outside the app. The driver should still log a fuel expense linking the transaction to the load.

Q. Why was an expense rejected? Usually missing receipt, unreadable receipt, wrong category, or personal expense flagged. The driver sees the reason on their side.

Reassignment

Q. Does reassignment reset the status? No. The new driver inherits the current status.

Q. Will the broker know about the swap? Not automatically. If the broker asks for an updated driver, tell them.

Q. Can the old driver still see the load after reassignment? No. The load disappears from their view immediately.

Q. Will the audit trail show the swap? Yes. Super Admin can pull the audit entry.

Notifications

Q. Can I turn off notifications? No granular controls. The feed is what it is.

Q. Why am I getting notifications for things I didn't do? The feed shows all dispatch-relevant events, not just yours. Multiple dispatchers' actions all surface in the same feed.

Q. Can I mark all as read? Yes — there's usually a "Mark all as read" button at the top of the feed.

Cancellations

Q. Can I cancel a load? No. Per the 2026-04-19 client decision, cancellation is Super Admin only. Escalate.

Q. What about deletion? Same. Super Admin only.

Q. What if a broker cancels a load I haven't assigned yet? Tell Super Admin to delete it. They'll remove it from the Job Board.

Q. What if a load was cancelled by mistake? Super Admin can restore from the deleted_loads table.

Working with drivers

Q. Can I see a driver's HOS in the app? LogisX doesn't currently track HOS itself. The drivers' ELDs (Routemate or similar) do.

Q. Can I see who a driver's emergency contact is? Super Admin → Drivers → driver detail.

Q. Why is a driver showing as "On Duty" but they say they're not? The app doesn't track on/off duty status the way an ELD does. "Active" in the app means "they have a load in an active state."

Reports and analytics

Q. Can I see weekly fleet stats? Some dashboard KPIs show fleet stats. Full P&L is in /admin/financials (Super Admin only).

Q. Can I export driver activity to a spreadsheet? Ask Super Admin. Data Manager has direct sheet access.

Q. Can I see how many loads I assigned this week? Not in a dedicated report. Sidebar → Notifications → filter by your actions, then count manually.

Technical

Q. Why is the dashboard sometimes slow? The system reads from Google Sheets. Sheets has a rate limit; we cache aggressively. A cache miss can be slow occasionally. Usually resolves within seconds.

Q. Can I work offline? No. The app needs a live connection for almost everything.

Q. Are sessions secure? Sessions use HTTPS, cookie flags (httpOnly, secure, sameSite=strict), and database storage. Standard web-security practices.

Career

Q. Can I move from dispatcher to Super Admin? Talk to leadership. Internal mobility depends on operational needs and your demonstrated capabilities.

Q. What if I want to give feedback about the app? Tell your supervisor or operations lead. Feedback is welcomed and shapes future improvements.

Q. Can I refer a friend? For a driver position, yes — most carriers welcome referrals. For dispatcher positions, depends on hiring.

That's the most common stuff. Anything else, ask Super Admin or leadership.
